## DETAILED ACTION

### *Claim Rejections - 35 USC § 102*

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 18-23, 33 and 34 are rejected under 35 U.S.C. 102(b) as being anticipated by US 5,510,164.

The reference discloses a WORM disc comprising a substrate, tellurium-based recording layer (photosensitive layer), a deformable layer, and a hard coat (second substrate). The deformable layer is a silicone layer which may be from 5-300um in thickness. See col. 3, lines 22-25. The disk may further have a metal layer formed thereon for reflecting the reading beam. See Embodiment 2.

### *Claim Rejections - 35 USC § 103*

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 24-32 are rejected under 35 U.S.C. 103(a) as being unpatentable over US 5,510,164 in view of US 6,544,616.

The '164 reference discloses the disc as described in the above rejection. It is recognized that the reference refers to double-sided discs but does not contemplate dual-layered discs, i.e. disc read from one side having multiple recording layers. The '616 reference shows that it is well known

Art Unit: 1794

to utilize dual-layered recording media where various recording materials are used, i.e. write-once, recordable, etc. See background. The medium comprises two patterned substrates, two recording layers, and two reflective layers. See Figure 4. The medium may further comprise dielectric layers on either side of the recording material (these layers protect against oxidation). See col. 9, line 46. The reference further shows that it is known to use multiple reflective layers when utilizing multiple recording layers. A semi-reflective reflective layer is used on the side of the disc closest to the incident beam and a fully reflective layer is used on the side of the disc farthest from the beam. See col. 10, second and third paragraphs. Therefore, as the '164 reference contemplates increasing the recording capacity by utilizing a double-sided medium, it would have been obvious to one of ordinary skill in the art to form a dual-layered medium as shown in the '616 reference. One would expect that providing the dual-layered medium would provide the predictable result of doubling the recording capacity.
